

CLAIMS

What is claimed is:

1. A management system, applicable on an enterprise data platform, for managing multiple logistic bodies, comprising:

an account registration module, for providing registration interface for said logistic bodies to fill in basic information, and generating a correspondent account numbers;

a data analysis module, having preset correlation rules, for deciding correlations among said current account number and other account numbers;

a correlation establishment module, for integrating and establishing said correlated account numbers and common registration code according to analysis result of said data analysis module, and

an account database, for storing said account numbers and basic information, and storing for each account number at least one correlated account numbers and a common registration code shared with said correlated account numbers for management purpose.

2. The management system of claim 1 wherein said basic information comprises at least a logic body name, an email address, a website address and a relative enterprise name.

3. The management system of claim 1 further comprises an approval system, for receiving signal from said data analysis module upon correlations decided, and generating an approval event to start an approval process.

4. The management system of claim 1 further comprises a trade system, for periodically providing a plurality of trade information to said data analysis module for deciding correlations among a plurality of account numbers.

5. The management system of claim 1 wherein said correlation rules are logical algorithms of full-text comparison and calculation for basic information and trade information of said logistic bodies.

6. The management system of claim 1 wherein said correlation establishment module operates according to result of said approval event of said approval system.

7. A management method, applicable on an enterprise data platform incorporated with a trade system and an approval system, for managing multiple logistic bodies, comprising steps of:

receiving basic information provided by a logistic body and generating a correspondent account number;

analyzing said basic information according to correlation rules;

comparing a current account number with a plurality of other account numbers;

generating an approval event and waiting for result when said current account number and said plurality of other account numbers have correlations; and

integrating and establishing said correlated account numbers with a common registration code when said approval event is verified.

8. The management method of claim 7 wherein said basic information comprises at least a logic body name, an email address, a website address and a relative enterprise name.

9. The management method of claim 7 wherein said correlation rules are logical algorithms of full-text comparison and calculation for basic information and trade information of said logistic bodies.

10. The management method of claim 7 further comprises steps of:

periodically reading trade information from said trade system;

analyzing accounting numbers in said trade information;

generating an approval event and waiting for result when said account numbers have correlations; and

storing and establishing said correlated account numbers with a common registration code when said approval event is verified.

11. The management method of claim 10 wherein said correlation rules are logical algorithms of full-text comparison and calculation for trade information of said logistic bodies.
